# DAY -11, DAILY REPORT, MONDAY - (22 -11 -2021)

Today, I had an  experience. I woke up in the morning and brushed my teeth, and I got ready for the cab. After that I had the session with my mentor Abin, and I did the html tags and how to create a html login page username and password. That is why  I am using the tags to create the login page with background designs. and  we used the tags <!doctype html> is to create a whole document.and i have typed the command called <html>  is the tag that is used for the whole document. And a head tag that is used for the head of the document. <title>Login Form</title> is the tag that is used for the title of the document. And the login button to create a page using username and password etc.  <link rel="stylesheet" type="text/css" href="style.css"> is the tag that is used for javascript and css. And is to style the command. </head> is the head of the document. <body> is the body of the document. <h2>Login Page</h2><br> is the tag that is used for the second heading of the document. And the br is the line break element. <div class="login"> is the tag that is used for class elements. And a login button to login in the page. form id="login" method="get" action="login.php"> is the tag that is used for the login method to get action in the login page. <label><b>User Name is to label the page. And the tag <b> is to bring attention to the element. And the <b> html element is used to draw the reader's attention to the element's contents. which are not otherwise granted special importance. This was formerly known

as the boldface element, and most browsers still draw the text in boldface. And to label the document in the next command. And after that we type input type = username to create a username tag, and after that, we will have the next command is the tag that is used for password etc. and style file is to use the command. After that task, for the next session to create a folder is the tag that is used for creating another folder.after that we can put it in the same folder and the next step is the touch file to create the folder and the next step is that i will create a folder, is to create three files in the folder. And we have the folder file that is used to create the folder and the file. And the next is to create a folder is to create another file in a folder. And the next thing is to create a folder that will be used in the three files in the same folder. And the next is to create the folder, and it has the three files in it, that's all for the day, thank you.
